

ChamiNexT

Stop memorizing. Start shipping.

The evaluation layer for engineering in the AI era — candidates ship real Work Tickets with AI; employers hire on the graded prompt trail.

v1.1 · August 2026 · chaminext.netlify.app

Technical hiring is testing the wrong thing.

- Algorithm loops reward memorization theater — the signal was weak before AI, and is dead after it.
- Take-homes are now unverifiable: you cannot tell what the candidate did versus what their model did.
- Senior engineers burn hours per loop and teams still mis-hire on real-world work.

70%

of candidates fail on real-world tasks despite strong whiteboard scores (senior-engineer reports)

\$150k–300k+

typical cost of one bad senior hire — the problem employers already budget against

Engineers ship with AI every day. Interviews pretend they don't.

- The question changed — not "can you code without AI" but "can you ship with it, verifiably".
- AI bans in assessments are unenforceable. Disclosure plus evaluation is the only stable equilibrium.
- A new artifact exists that older platforms never captured: the prompt trail — how a candidate decomposes, verifies, and iterates with an agent.

Decomposition

Verification

Iteration

AI disclosure

Their prompts give away their thinking process.

Did they clarify constraints first? Ask for edge cases? Verify or paste blindly? Iterate when something failed? A prompt log is a decomposition trace — harder to fake than a green checkmark.

GRADED PER PROMPT

- Constraints before code?
- Asked for edge cases?
- Verified or pasted blindly?
- Disclosed AI use?

Candidates run real company loops — not puzzles.

- Six salary-banded company-style interview loops on the landing page (AI infra, quant, big tech, frontier labs).
- Work Tickets run in a browser Cursor-style studio: editor, terminal, tests, and a coding agent.
- AI is allowed — every prompt is logged and becomes part of the submission package.
- Plus AI mock interviews, ship tests (24h/72h/7d), and behavioral coaching on the same rubric.

Employers get a recommendation — not a scoreboard.

- Raw prompt trail, unedited — exactly what the candidate asked the agent, in order.
- Per-prompt rubric grades: decomposition, verification, iteration, AI disclosure.
- Composite scores are supporting detail; the deliverable is a clear verdict with strengths, gaps, and live-round probes.
- Per-loop dashboards: assigned stages, candidate pipeline, one-click full assessment.

STRONG ADVANCE

Strong hire signal — advance to final round.

+ Shipped passing code; prompts show verification

- Probe live: how they verified AI-written tests

Thinking 84 · Prompt trail 78 · Shipping 82

Verdicts: Strong advance / Proceed /

Borderline / Do not advance

One loop, both sides of the table.

Same rubric on both sides: candidates practice on it, Interview Studio ranks on it.

Two-sided: candidates subscribe, companies pay for signal.

Candidates

- Daily — €0 free front door
- Sprint — €149 one-time · 90 days
- Season — €49/mo · cancel anytime

Companies

- Small Business — €250/mo
- Growth — €900/mo
- Enterprise — custom · SSO · ATS/API
- 60-day free pilot on all paid tiers

Founding cohort

- FOUNDING40: 40% off
- First 30 payers
- Design partners shape rubrics

Base case revenue path (deck): ~€230k Y1 › ~€1.15M Y2 with B2B design partners

Everyone grades output. Nobody grades the trail.

LeetCode

Grades final answer only — no thinking-process trail; signal dead under AI

HackerRank

Async pass/fail on output — no prompt trail or mandatory walkthrough

getcracked

Strong quant prep intel — no live process grading or employer-side eval

ChamiNext

Thinking process graded on both sides — practice builds the trail; Interview Studio ranks on it

What's hard to replicate

Prep tools (LeetCode, getcracked) never see hire outcomes. Screening tools (HackerRank) never see daily practice or prompt trails at scale. Owning both on one eval stack is the moat.

DATA FLYWHEEL

Prompt / reasoning trace › live defense › ship artifact › talent profile › employer rank › hire outcome › rubric recalibration

Prep tools never see hire outcomes; screening tools never see daily practice. Owning both sides on one rubric compounds.

Live product. Founding pilots open.

LIVE TODAY — chaminext.netlify.app

- Six company-style interview loops with salary bands and 4-stage runners
- Browser coding studio: Monaco editor, terminal, sandbox tests, coding agent
- Prompt-trail grading engine + employer hire recommendations
- Per-loop employer dashboards, Stripe-backed pilots, investor briefing

NEXT

- Design-partner pilots: calibrate rubrics on real "great hire" stories
- Server-backed workspaces and accounts
- Outcome-calibrated grading (which prompt signals predict good hires)
- ATS integrations and enterprise rubric packs

Join the founding cohort.

- Companies: founding design-partner pilots — 60-day free trial, rubrics calibrated to your bar.
- Angel structures: \$20–50k SAFE (\$2M cap) or 1.5× payback on attributed B2B over 24 months
- Warm intros to growth-stage engineering leaders hiring in the next two quarters.
